Sir, the recent report on “GeneXpert in the diagnosis of smear-negative PTB” is very interesting [1]. As Nakiyingi et al. noted, the concern on cost effectiveness on this new TB diagnostic tool is needed [1]. In fact, the cost effectiveness of the test is still controversial issue [2 - 3]. Also, Nakiyingi et al. raised an important point that GeneXpert can help fasten diagnosis. However, it is questionable whether we actually need such a very fast result. The GeneXpert might not add any important clinical usefulness to the use of classical culture.
