ABSTRACT

Anti-inflammatory activity of the ethanolic extract of the leaves of Morus indica Linn. was studied in wistar rats using the carrageenan induced left hind paw edema, carrageenan induced pleurisy and cotton pellet induced granuloma model. The ethanolic extract (100 mg/kg, p.o.) inhibited carrageenan induced rat paw edema. It also showed an inhibitory effect on leukocyte migration and a reduction on the pleural exudates as well as reduction on the granuloma weight in the cotton pellet granuloma method. The results indicated that the ethanolic extract produced significant (p < 0.05) anti-inflammatory activity when compared with the standard and untreated control.

Keywords: Anti-inflammatory, Morus indica

MATERIALS AND METHODS

Plant Material

The leaves of the plant were collected from the foothill of Yercaud, Salem, in the month of December 2003 and cleaned to remove the debris. The collected leaves were identified and authenticated by a botanist Dr. A. Marimuthu, Department of Botany, Government Arts College, Salem. A voucher specimen (MIA-1) has been kept in our museum for future reference. The leaves were shade dried at room temperature for 10 d and coarsely powdered with the help of a hand-grinding mill and the powder was passed through sieve No. 60.

Preparation of the Extract

The powder of leaves of M. indica was extracted separately by continuous hot extraction process using soxhlet apparatus with different solvents in increasing order of polarity from petroleum ether, chloroform, acetone, alcohol, to finally chloroform:water [4]. After extraction, the extracts were concentrated under reduced pressure in tared vessel. The marc of crude drug powder was then once again subjected to successive extraction with other solvents and the extractive values were calculated with reference to the air-dried drug. The dried extracts were subjected to various chemical tests to detect the presence of different phytoconstituents.

Carrageenan Induced Pleurisy In Rats

The animals were divided into three groups of six rats each as described in the carrageenan induced paw edema model [8, 9] and each were pretreated with ethanolic extract of M. indica (100 mg/kg, p.o.), Indomethacin (10 mg/kg, p.o.) or normal saline (0.1 ml). One hour later all the animals were received 0.25 ml of an intrapleural injection of 1% carrageenan on the right side of the thorax. The animals were sacrificed 3 h after carrageenan injection by ether inhalation. One ml of heparinized Hank’s solution was injected into the pleural cavity and gently massaged to mix its contents. The fluid was aspirated out of the cavity and the exudates were collected. The number of migrating leukocytes in the exudates was determined with Neubauer chamber. The values of each experimental group were expressed as mean ± SEM and compared with the control group.

Cotton Pellet Granuloma Model

In cotton pellet granuloma model the animals were divided into three groups as described in the carrageenan induced paw edema model. The method of Penn et al [10] with slight modification was used. The animals were anaesthetized with pentobarbitone (30 mg/kg, s.c.). The back skin was shaved and disinfected with 70% ethanol. An incision was made in the lumbar region. Subcutaneous tunnels were formed by a blunted forceps and a sterilized, pre weighed cotton pellet was placed on both sides in the scapular region. The animals were treated with indomethacin (10 mg/kg, p.o.) and ethanolic extract of M. indica for 7 days. Then, the pellets were dissected out and dried until the weight remained constant. The net dry weights, i.e. after subtracting the weight of the cotton pellet were determined.

Results Analysis

All values were expressed as mean±SEM. The data were statistically analyzed using one way ANOVA followed by Newman Keul’s multiple range test and differences below p < 0.05 are considered as significant.

RESULTS

The leaves of M. indica were collected from the foothill of Yercaud, Salem, air-dried and extracted by continuous hot extraction process using soxhlet apparatus. The average percentage yield of alcohol extract of M. indica was found to be 2.2% w/w. On preliminary phytochemical screening of the leaves of M. indica revealed the presence of alkaloids, flavonoids, saponins and tannins. The LD50 was found to be 1149 mg/kg for ethanolic extract of M. indica.

*p <0.05 when compared with control. Values are expressed as mean±SEM (n=6).
The effect of ethanolic extract of *M. indica* on carrageenan-induced edema in rats is shown in Table 1. The results obtained indicate that the ethanolic extract had significant anti-inflammatory activity in rats. The ethanolic extract of *M. indica* reduced the edema induced by carrageenan by 56.76% on oral administration of 100 mg/kg, as compared to the untreated control group. Indomethacin (10 mg/kg, p.o.) inhibited the edema volume by 64.86%.

The effect of ethanolic extract of *M. indica* on carrageenan-induced pleurisy in rats is shown in Table 2. The volume of pleural exudates in the control group was 0.35±0.002 ml. Animals treated with the ethanolic extract of *M. indica* (100 mg/kg, p.o.) decreased the pleural exudates to 0.17±0.001 ml and treatment with Indomethacin (10 mg/kg, p.o.) produced the exudates of 0.12±0.001 ml. The leukocyte count for the control group was found to be 4.53±0.33×10³ cells/ml. Animals treated with the test extract and standard produced a leukocyte migration of 0.51±0.08×10³ and 0.43±0.08×10³ cells/ml, respectively.

The effect of ethanolic extract of *M. indica* on cotton pellet induced granuloma in rats is shown in Table 3. In this the mean weights of the cotton pellets were determined. The weight of the granuloma for the control group of animals was found to be 58.2±2.04 mg. Treatment with the ethanolic extract of *M. indica* (100 mg/kg, p.o.) decreased the granuloma weight to 27.3±0.82 mg. Treatment with Indomethacin (10 mg/kg, p.o.) produced a granuloma weight of 20.7±0.65 mg. The ethanolic extract of *M. indica* and Indomethacin, both inhibited the granuloma tissue formation. The inhibition of the test extract and standard drug was found to be 53.1 and 64.4%, respectively.

**DISCUSSION**

Due to the increasing frequency of intake of NSAID’s and their reported common side effects, there is need to focus on the scientific exploration of herbal drugs having fewer side effects. So, there is a continuous search for indigenous drugs, which can provide relief to inflammation. The traditional medical practitioners of Kolli hills, Tamilnadu, use this plant to cure inflammation. To give a scientific validation to this plant, an attempt was made to study the anti-inflammatory activity.

Carrageenan induced inflammation is a biphasic phenomenon [11]. The first phase of edema is attributed to release of histamine and 5-hydroxytryptamine. Plateau phase is maintained by kinin like substances and second accelerating phase of swelling is attributed to prostaglandin like substances. The knowledge of these mediators involved in different phases is important for interpreting mode of drug action.

The tests performed with the ethanolic extract of *M. indica* in the pleurisy model showed that the extract behaves as an inhibitor of leukocyte migration and the formation of pleural exudates when given orally, as reported earlier [12].

In the cotton pellet granuloma model, inflammation and granuloma develops during the period of several days. This model is an indication for the proliferative phase of inflammation. Inflammation involves proliferation of macrophages, neutrophils and fibroblasts, which are basic sources of granuloma formation. Hence, the decrease in the weight of granuloma indicates that the proliferative phase was effectively suppressed by the ethanol extract of *M. indica*.

Thus it can be concluded that the leaves of the plant *M. indica* possess significant anti-inflammatory activity in rats. Further studies involving the purification of the chemical constituents of the plant and the investigations in the biochemical pathways may result in the development of a potent anti-inflammatory agent with a low toxicity and better therapeutic index.

**ACKNOWLEDGEMENT**

We thank Dr. B. Jayakar, Principal, Vinayaka Mission’s College of Pharmacy, Salem, for his encouragement and support throughout the work.
